Consulting and Implementaion Team	36

Executive Summary

Al Turath University (ATU) aspires to become a cutting-edge, innovative institution through an institution-wide transformation that amplifies reputation, academic quality and long-term sustainability. This proposal therefore sets out a five-to-ten-year Digital-and-Institutional-Health Roadmap, underpinned by industry-validated digital-maturity frameworks and an internationally benchmarked organisational-health diagnostic spanning twelve strategic domains. Digital capability is treated both as its own domain and as the horizontal enabler for governance, teaching, research, employability, student experience, partnerships, recruitment, marketing, alumni, organisational capability and employer engagement.

Key messages for the Board

One integrated lens. Global Reputation is an outcome of interconnected domains—governance, teaching, research, employability, student experience, partnerships, recruitment, marketing, alumni relations, organisational capability, employer links and Digital Capability & Data. Digital is both a twelfth domain and the horizontal enabler of the other eleven.

Evidence-based diagnostic. A focused assessment—interviews, focus groups, document and data review—will rate each domain on a five-level maturity scale (Initial → Optimised) and produce a heat-map of strengths and gaps.

Digital as an accelerator. Modern infrastructure, IoT, AI (including agentic and generative), blended learning and hologram classrooms are mapped to specific gaps, so that every technology pound lifts multiple reputation drivers.

Phased delivery, measurable impact. A three-phase roadmap (Foundation 2025-26, Integration 2027-28, Optimisation 2029+) targets at least six domains reaching Established maturity by 2028, with Teaching & Learning and Governance achieving Optimised. Progress will be tracked through dual dashboards covering digital maturity metrics and organisational-health KPIs.

Phased delivery, measurable impact. Aligning with national policy for “fifth-generation” universities and showcasing cutting-edge pedagogy will enhance rankings, attract talent and partners, and position ATU as a regional leader in digital innovation.

Endorsing this roadmap commits ATU to a holistic, data-driven transformation that simultaneously strengthens institutional health and digital capability, delivering durable gains in reputation and stakeholder value.

1. Institutional Health, Reputation and Digital Capability

Reputation cannot be engineered by tweaking a handful of variables; it is the product of a system. ATU therefore adopts a **12-domain Institutional-Health Framework**, expanding the classic eleven organisational domains with **Digital Capability & Data** to capture the foundational role of technology and analytics:

- Governance
- Teaching, Learning & Assessment
- Research & Innovation
- Employability & Employer Partnerships
- Organisational Capability
- Student Experience
- Alumni Engagement
- Marketing & Social Media
- International & Local Partnerships
- International Recruitment (Faculty & Students)
- Employer Partnerships (sector-specific)
- Digital Capability & Data

Each domain is rated on a five-level maturity scale (Initial → Emerging → Developing → Established → Optimised) to expose systemic weaknesses and guide investment.

Digital Transformation Levers and Benefits by Domain

Domain	Digital Transformation Lever	Reputation/Quality Benefit
Governance	Real-time data-lake dashboards; AI scenario-planning	Faster, transparent decisions
Teaching & Learning	LMS upgrade, adaptive AI tutors, hologram lectures	Engaging pedagogy; higher student satisfaction
Research & Innovation	AI/Data-Analytics Lab; cloud HPC credits	More publications and grants
Employability	IoT maker-spaces; AI micro-credentials	Job-ready graduates; stronger employer brand
Organisational Capability	Digital Fellows scheme; agentic-AI productivity tools	Digitally fluent workforce
Student Experience	24/7 multilingual chat-bots; personalised mobile nudges	Higher retention and wellbeing
Alumni Engagement	CRM + AI personalisation; virtual/hologram reunions	Stronger giving and mentoring culture
Marketing & Social Media	Social-listening analytics; AI content engine	Sharper brand narrative; wider reach
Partnerships	Hologram co-teaching; shared data dashboards	High-impact alliances
International Recruitment	Virtual campus tours; AI lead-scoring chat-bots	Larger, more diverse applicant pool
Employer Partnerships	IoT hackathons; industry dashboards	Increased placements and sponsorships
Digital Capability & Data	Modern infrastructure, hybrid cloud, cybersecurity uplift	Resilient foundation enabling all domains

1.1 How Digital Lifts Every Domain

Domain	Digital-transformation lever	Reputation/quality benefit
Governance	Real-time data-lake dashboards; AI scenario-planning	Faster, transparent decisions
Teaching & Learning	LMS upgrade, adaptive AI tutors, hologram lectures	Engaging pedagogy; higher student satisfaction
Research & Innovation	AI/Data-Analytics Lab; cloud HPC credits	More publications and grants
Employability	IoT maker-spaces; AI micro-credentials	Job-ready graduates; stronger employer brand
Organisational Capability	Digital Fellows scheme; agentic-AI productivity tools	Digitally fluent workforce
Student Experience	24/7 multilingual chat-bots; personalised mobile nudges	Higher retention and wellbeing
Alumni Engagement	CRM + AI personalisation; virtual/hologram reunions	Stronger giving and mentoring culture
Marketing & Social Media	Social-listening analytics; AI content engine	Sharper brand narrative; wider reach
Partnerships	Hologram co-teaching; shared data dashboards	High-impact alliances
International Recruitment	Virtual campus tours; AI lead-scoring chat-bots	Larger, more diverse applicant pool
Employer Partnerships	IoT hackathons; industry dashboards	Increased placements and sponsorships
Digital Capability & Data	Modern infrastructure, hybrid cloud, cybersecurity uplift	Resilient foundation enabling all domains

1.2 Diagnostic Methodology

Toolkit – Internationally benchmarked Organisational-Health Diagnostic combined with an industry-standard Digital-Maturity Benchmark.

Data collection – Structured questionnaires, focus groups (faculty, students, staff), one-to-one interviews, document review and system-log analysis.

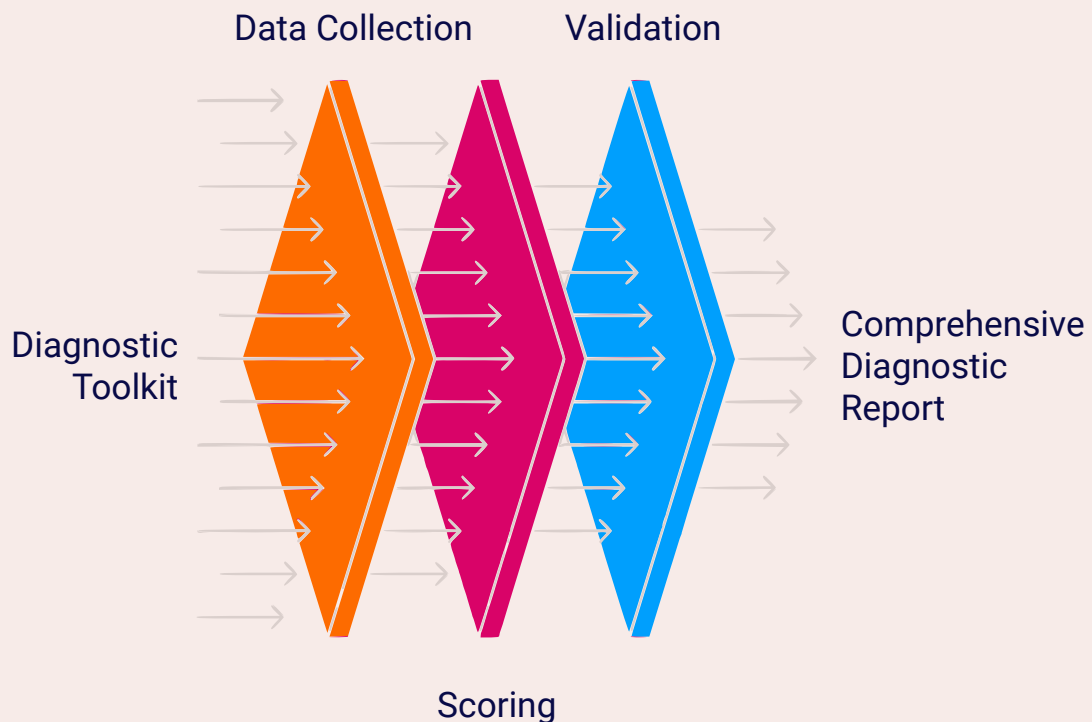

Scoring – Independent assessors apply a rubric that rates each practice at system, organisational, process and individual levels; outputs include a narrative report, heat-map and quantified scores

Validation – Findings triangulated with external benchmarking data from global ranking agencies and regional peers to ensure objectivity.

Diagnostic Methodology Funnel

1.3 Ranking Strategy Sample – turning maturity gains into national and global visibility

Caution first. League-table performance depends on factors that lie partly outside the University's control (peer-reputation surveys, global citation flows, ministerial data cycles). We therefore present **scenario-based targets**—baseline, stretch, aspirational—all contingent on the Board sustaining the investments and policy changes set out in this roadmap.

1.3.1 How the 12-domain framework feeds the main ranking systems

Ranking	Principal metric families	Typical weight range*	Framework domains most affected
Iraq National University Ranking (MoHESR)	Teaching quality, research output, patents, community engagement	variable by call	Governance; Research & Innovation; Student Experience; Partnerships
QS World University Rankings (2026 cycle)	Academic reputation, employer reputation, citations/faculty, faculty–student ratio, sustainability, internationalisation	30 % / 15 % / 20 % / 10 % / 5 % / 10 % Top Universities	Touches 10 of 12 domains, esp. Research, Employability, Intl Recruitment
THE World University Rankings (WUR 3.0)	Teaching, research environment, research quality, international outlook, industry income (18 indicators)	29 % / 29 % / 30 % / 8 % / 4 % Times Higher Education (THE) Times Higher Education (THE)	All 12 domains incl. Digital Capability & Data

*latest published weightings at time of writing.

1.3.2 Data-collection & submission workflow

- ◆ **Rankings Task-Force** chaired by the Registrar; members from Research Office, Careers, International Office, CIO.
- ◆ **Unified data-lake feeds** (HR, SIS, finance, research, smart-campus IoT) ensure one-click extraction for QS/THE/ templates.
- ◆ **Automated quality gates** flag anomalies (e.g., mismatched faculty FTE, duplicate DOIs).
- ◆ **Survey-engagement plan** – annual refresh of academic- and employer-contact lists; social-media campaign to boost response rates (QS/The/ARWU Academic Reputation & Employer Reputation indicators).
- ◆ **Submission calendar** – Apr (QS portal) → Jun (THE portal) → Aug (MoHESR national call) → Dec (ARWU) each year.

1.3.3 Scenario-based ranking trajectory (illustrative)

Year	National (Iraq)	QS global band	THE global band	Assumptions met?
Baseline – minimal new funding	Top 20	Data-qualifier only	n/a	infra & data-lake only
Stretch – full Phase 1–2 delivery	Top 10	801–1000	1201+	+ 100 Scopus pubs p.a.; ≥ 5 % int'l students
THE World University Rankings (WUR 3.0)	Top 5	601–800	801–1000	≥ £X m research grants; rep-survey hit-rate > 2× sector norm

Scenario chosen at the Integrated Mid-Point Review (end of Y4) once input KPIs are audited.

1.3.4 Critical institutional commitments (2025-28)

Commitment	Owner	KPI threshold
Research funding pool	VP Research	≥ £ X m / yr by 2027
Publication pipeline mentoring	Deans	≥ 100 Scopus papers p.a.
International student recruitment budget	Intl Office	≥ 5 % head-count by 2027
Rankings Task-Force staffing	Registrar	2 FTE analysts + data engineer
Data-governance policy ratified	Board	Q4 2025

1.3.5 Risk register & mitigations

Risk	Likelihood*	Impact on ranking	Mitigation
Publication output below target	M	Delays QS/THE rise	Bridge-grants; co-authorship MoUs
Low academic-survey response	H	Cap QS AR score for 2 yrs	Early-contact refresh; leverage diaspora academics
Data-submission errors	M	Possible disqualification	Third-party audit; sandbox validation scripts
Budget re-allocation	V	Slows infra & AI roll-out	Stage procurement; tap external donors

*assuming Board endorses full roadmap: H = high, M = medium, V = variable.

1.3.6 Progress gates

- **Quarterly** – dashboard shows input metrics (publications, employer engagement, survey response rates).
- **End Y4 Mid-Point Review** – if $\geq 70\%$ of input KPIs are on track, move to “Stretch” scenario; otherwise re-vert to “Baseline” trajectory and re-plan communications.
- **Annual** – publish a “Data Quality & Ranking Progress” note to Board and website for transparency.

1.3.7 Disclaimer for Board papers

All ranking scenarios are projections contingent on the institutional commitments above and external factors (global survey sentiment, peer performance). They should be treated as directional targets, not guarantees.

1.3.8 Initial Ranking Consultation Roadmap

Milestone	Timing
Kick-off meeting	14 days after contract signature
Data-gathering sprint (incl. 3-day campus visit)	Weeks 1-3
Draft Diagnostic Report + Heat-Map	End of Week 5
Final Roadmap delivered	Week 7

2. Digital Modern Infrastructure

A secure, high-performance digital infrastructure is the foundation of this transformation. We will modernise the University's IT environment to support current needs and future growth. Modern infrastructure typically includes cloud computing services, hyper-converged systems, and advanced cybersecurity tools, all integrated to enhance performance, scalability and security. Key actions in this area include:

Network Upgrades: Upgrading campus networks (high-speed fibre backbone, Wi-Fi 6/6E coverage) to ensure fast, reliable connectivity in all facilities. This enables seamless access to online resources, cloud services, and collaborative tools for students and staff. Improved bandwidth and low-latency networking are essential as data-intensive applications (e.g. AI, video streaming) grow.

Cloud and Data Center Optimisation: Adopting a hybrid cloud strategy to balance on-premises and cloud workloads for flexibility and resilience. Core administrative systems (e.g. student information system, finance ERP) and learning platforms can be progressively migrated or integrated with cloud services for better scalability. This reduces dependence on ageing hardware and allows rapid scaling of resources during peak demand. Sensitive data or low-latency services may remain on-premises, while other applications leverage reliable cloud infrastructure.

Hyper-Converged Infrastructure: Consolidating computing, storage, and networking using hyper-converged infrastructure (HCI) where appropriate, to simplify management and increase resource efficiency. This will enable easier expansion of capacity as the university grows and reduce long-term costs by eliminating siloed legacy systems.

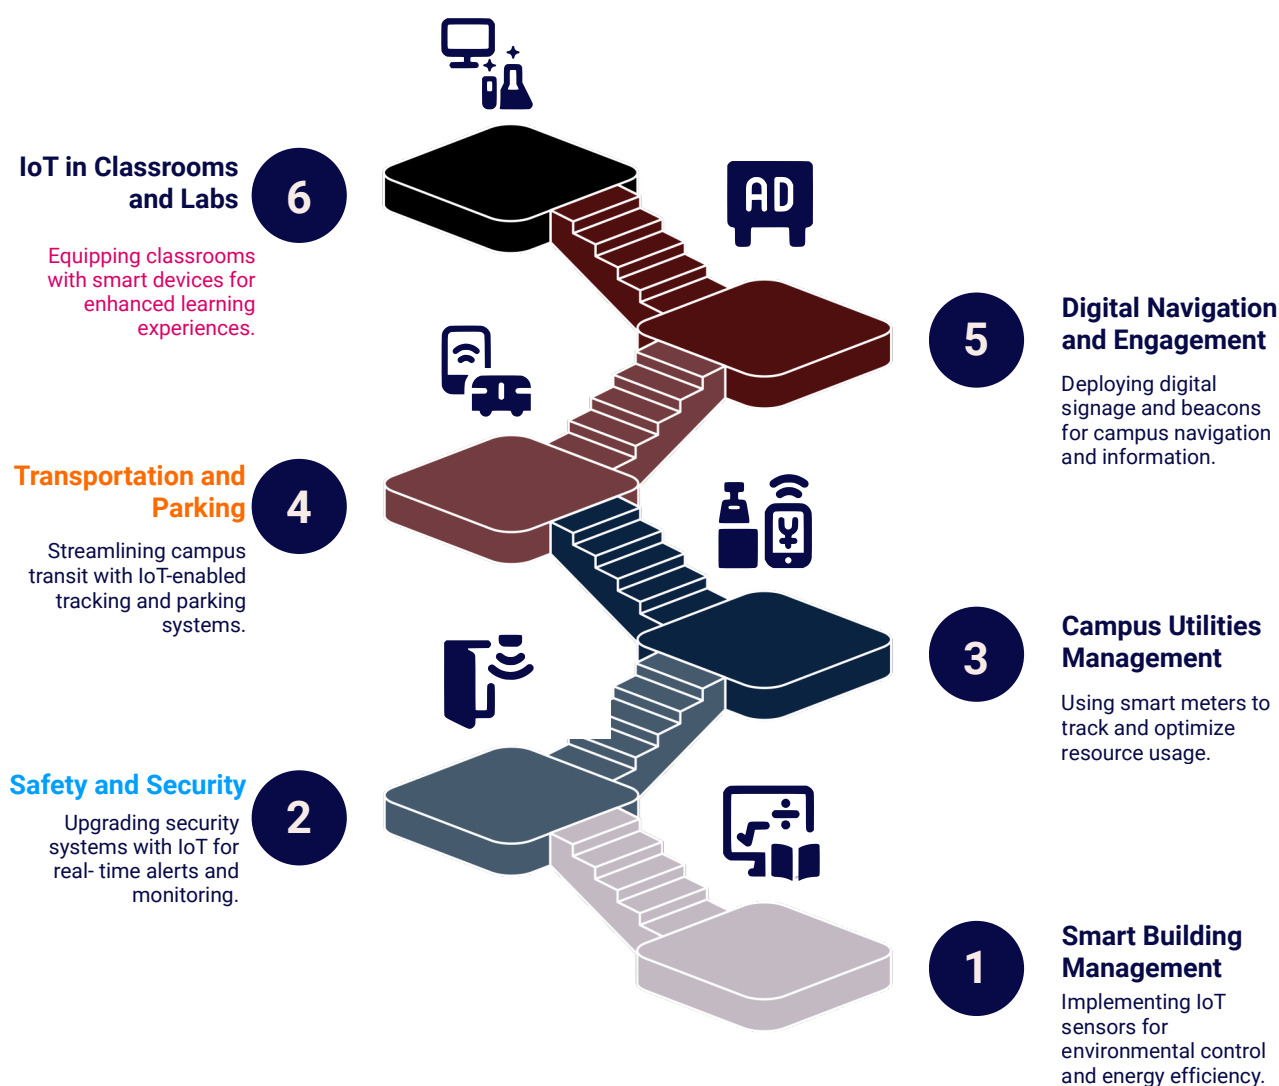

Cybersecurity and Reliability: Strengthening cybersecurity measures (firewalls, intrusion detection, endpoint security) to protect institutional data and privacy. Modernising infrastructure goes hand-in-hand with robust security frameworks to mitigate cyber threats, which increasingly target higher education. Systems will be designed with redundancy and disaster recovery plans to ensure high availability.

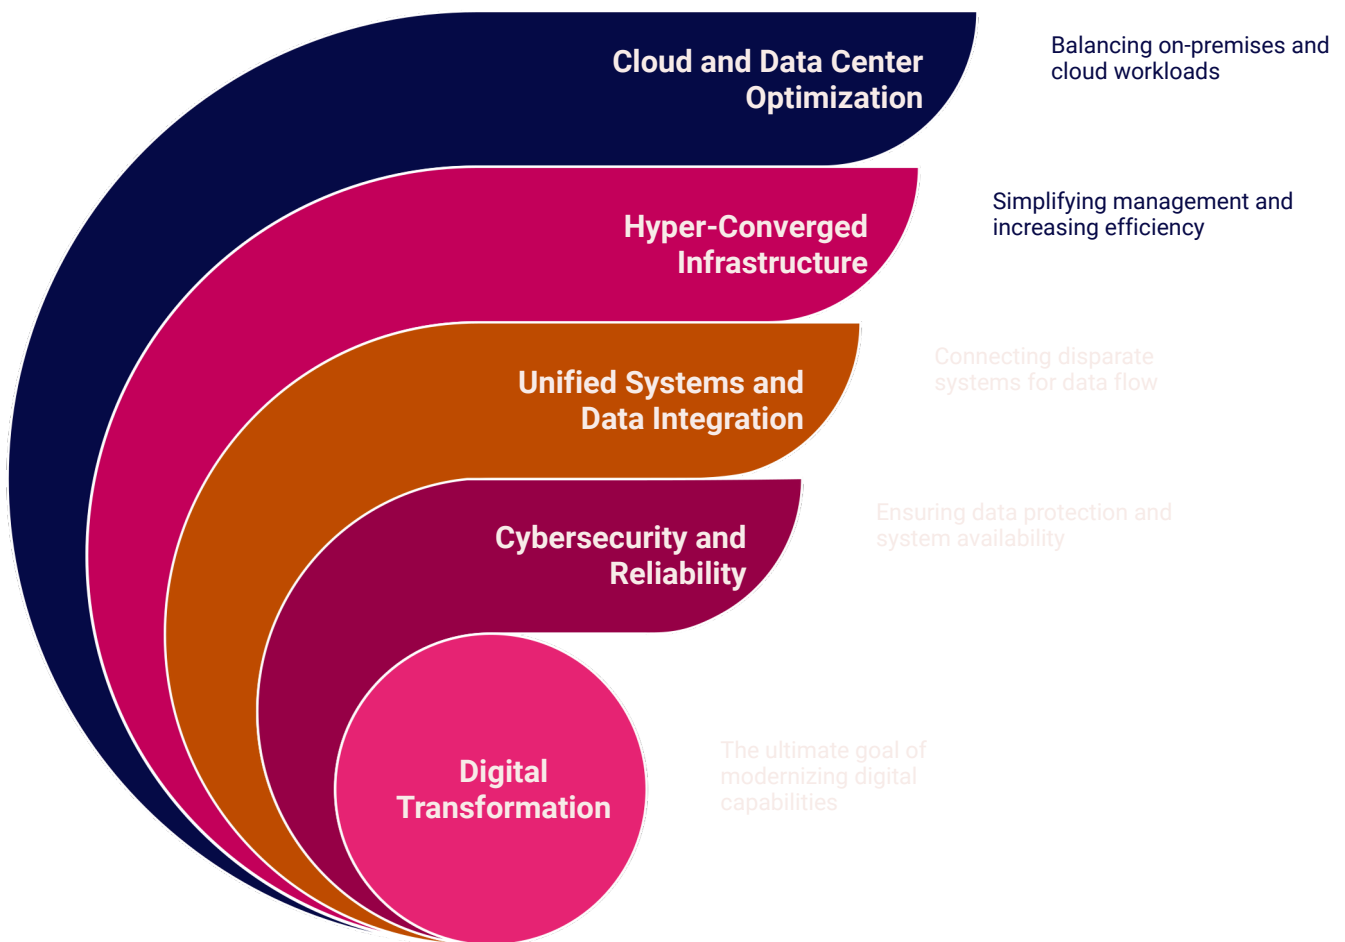

Unified Systems and Data Integration: Ensuring that disparate systems (LMS, library systems, HR, etc.) are interoperable and that data can flow between them securely. A modern data architecture (using APIs and possibly a data warehouse) will support analytics and AI initiatives by providing quality data across the institution.

These upgrades will create a flexible framework that meets current operational needs while adapting to future technology advances. In the short term, a thorough assessment of existing infrastructure will identify gaps or outdated equipment. Investments will then be prioritised for high-impact areas (for example, upgrading networks to be “AI-ready” for upcoming initiatives). By establishing a strong digital backbone now, AI Turath University enables all other transformation initiatives – from IoT devices to AI applications – to function effectively and securely.

Achieving a Smart Campus

Digital Transformation at Al-Turath University

3. Internet of Things (IoT) on Campus

To evolve into a smart campus, we will assist the University in deploying Internet of Things solutions under the emerging concept of the “**Internet of Educational Things (IoET)**”. IoT sensors and connected devices can greatly enhance campus operations, safety, and the environmental comfort of learning spaces. Our IoT strategy focuses on:

Smart Building Management: Installing IoT sensors for temperature, air quality and lighting control in classrooms and offices. Automated HVAC systems will monitor and adjust heating, ventilation and air conditioning to maintain optimal learning conditions. Smart lighting systems can turn off lights in empty rooms and adjust brightness or colour temperature to match natural daylight, improving concentration and saving energy. These measures improve comfort and student engagement and reduce utility costs through energy efficiency.

Safety and Security: Upgrading fire alarms, smoke detectors, and security cameras to IoT-enabled systems that provide real-time alerts and remote monitoring. For example, IoT fire detection systems can speed up emergency response through automated alerts. Smart access control using ID cards or mobile app readers can log entries and exits, integrating with occupancy monitoring to determine which areas are in use. Intrusion alarms and CCTV analytics can likewise become smarter by communicating over the network, contributing to a safer campus environment.

Campus Utilities Management: Using smart meters and sensors to track **real-time power and water usage**. This data allows the facilities team to identify wastage, optimise consumption, and reduce operating costs. IoT-based water leak detectors or electrical load monitors can preempt maintenance issues, preventing damage or outages.

Transportation and Parking: Streamlining campus transportation with IoT solutions. For instance, sensors on shuttle buses and parking lots enable shuttle tracking, real-time bus schedules, and smart parking systems to manage space availability. Notably, the University of Michigan has leveraged IoT to better manage its campus transit services, providing live updates to users and improving efficiency. Al Turath can implement a similar approach so that students and staff use a mobile app to view bus locations or open parking spots, reducing frustration and commute times.

Digital Navigation and Engagement: Deploying IoT beacons or interactive digital signage to help students and visitors navigate the campus and locate resources. Connected digital notice boards can display live information (events, class changes, safety notices) and even generate advertising revenue. Such “smart campus” features enhance day-to-day convenience and modernise the university’s image for prospective students.

IoT in Classrooms and Labs: Equipping classrooms with smart devices (interactive screens, IoT-enabled projectors, occupancy sensors) to automate attendance and environmental settings. Research is underway globally on using IoT to optimise classroom conditions – e.g. tracking noise levels, CO2, or even student fidgeting – to maximise engagement and focus. While some of these innovations are experimental, AI Turath can begin by implementing proven tools like RFID-based attendance, smart boards, and IoT lab equipment for real-time monitoring of experiments.

IoT solutions improve student engagement, help campus users navigate facilities, and streamline administrative tasks. We will start with pilot projects in critical areas (such as energy management and security) and scale up based on results. Data collected from IoT systems will feed into analytics dashboards to inform decision-making (for example, optimising classroom scheduling based on usage patterns). Establishing a smart campus yields cost savings and safety benefits. It provides rich learning opportunities – students in engineering or IT fields can directly work with the IoT systems as part of their course-work or projects. This integrated approach will gradually transform AI Turath University into a fully instrumented, intelligent campus on par with leading international universities.

4. Digital Teaching and Learning

Transforming teaching and learning practices is at the heart of the University's digital strategy. We will support Al Turath University's adoption of a Digital Learning ecosystem that blends pedagogy, research and best practice, with technology to improve access, quality, and student outcomes. This aligns with international trends where universities invest in digital tools to drive better learning and student success. Our approach includes:

Learning Management System (LMS) Enhancement: Building on or upgrading the University's LMS to serve as a central digital hub for all courses. The LMS will host e-learning content (lecture slides, readings, videos), facilitate online assignments and quizzes, and support discussion forums and collaboration. Ensuring that every course has an effective online presence provides flexibility for students to learn at their own pace and review materials anytime. Integrating the LMS with other systems (registration, library databases, etc.)

will create a seamless experience. We will also explore adding a mobile app for on-the-go access and push notifications (e.g. assignment deadlines).

Blended and Online Learning: Encouraging a shift toward blended learning models, where face-to-face instruction is enriched with online activities. Faculty will be supported in redesigning courses to include interactive videos, simulations, or virtual labs where appropriate. This enhances on-campus classes and lays the groundwork for offering fully online courses or programs in the future, expanding Al Turath's reach to learners beyond Baghdad. We will

study case examples of top universities that leveraged blended learning to increase engagement and will adapt best practices to our context.

Integrating Employability Through Digital Teaching and Learning: Developing a leading digital teaching and learning offering provides a powerful opportunity to embed employability across the curriculum in a scalable and sustainable way. By leveraging intelligent digital agents, academic staff can receive real-time, research-informed guidance on integrating employability learning, authentic assessment, and industry-relevant scenarios into their course design and delivery. These AI-powered agents can prompt

labour market trends, suggest work-based learning models, and support the adoption of pedagogical strategies that enhance graduate readiness. This strengthens learning outcomes and positions the institution as a leader in digitally enabled, career-focused education.

Digital Content and Open Educational Resources (OER): Investing in creating and curating high-quality digital content. A dedicated team or center for teaching innovation can help faculty produce multimedia lecture recordings, podcasts, or virtual reality content for immersive learning. Faculty will also be encouraged to adopt OER (open-access textbooks, etc.) wherever possible to reduce student costs. Over time, Al Turath could contribute by developing its digital learning materials in Arabic and English, showcasing the university's academic strengths.

Faculty Development and Digital Pedagogy: Providing extensive training and support for instructors to use digital tools effectively. This includes workshops on online course design, use of the LMS features, video conferencing pedagogy, and data-driven teaching techniques. Building digital confidence in faculty is critical – international frameworks note that workforce development and culture change are key to successful digital learning initiatives. We propose creating a faculty *Digital Teaching*

Fellows program to mentor peers in innovative teaching methods. Empowered with the right skills, Instructors can leverage technology to create more engaging, student-centred learning experiences (such as flipped classrooms or collaborative projects using online platforms).

Student Support and Success Analytics: Utilising digital tools to support students outside the classroom. This involves implementing early alert systems that track academic performance data and flag at-risk students for timely intervention. Predictive analytics (e.g. based on LMS engagement or grades) can help advisors personalise student support, boosting retention and success rates. Many universities focus on such data-driven student success initiatives – for instance, predictive analytics is widely seen

as a solution to improve outcomes. AI Turath will ensure that any analytics are used ethically and with human oversight, aligning with best practices. Additionally, online tutoring services or AI-assisted study tools (addressed in the AI section) will complement traditional support services.

Collaboration and Global Learning: Expanding the use of video conferencing and virtual collaboration tools to enable guest lectures, international classroom link-ups, and remote learning options. As a precursor to holographic teaching, we recommend regularly using webinars and virtual classrooms (e.g., via Microsoft Teams, Zoom) to bring global experts into AI Turath's lectures. Students can also collaborate online

with peers from partner universities on projects, preparing them for a connected world. The university enhances students' digital literacy and cross-cultural communication skills by normalising digital collaboration.

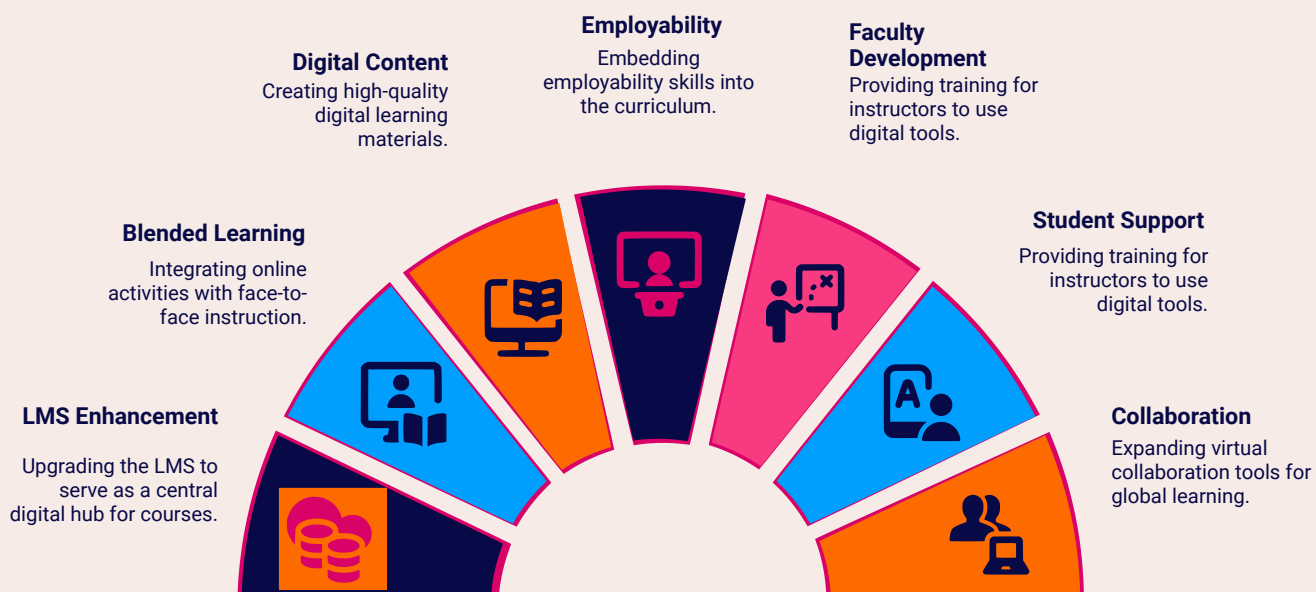

The aim is to make learning more flexible, engaging, and personalised digitally. Notably, surveys show that students appreciate robust digital offerings – in one EY study (2022), 91% of students said digital tools met or exceeded their expectations for teaching and learning.

By systematically improving our digital learning environment, Al Turath University will similarly raise student satisfaction and learning outcomes. This will position the university as a forward-looking institution that equips graduates with modern skills and capabilities crucial for success.

All digital teaching initiatives will be continually assessed via feedback and learning analytics to ensure quality and effectiveness. Furthermore, our strategy stays inclusive: we will provide necessary digital access and training to all students (including those with disabilities or from disadvantaged backgrounds) so that the benefits of digital education are equitably distributed.

Digital Learning Strategy

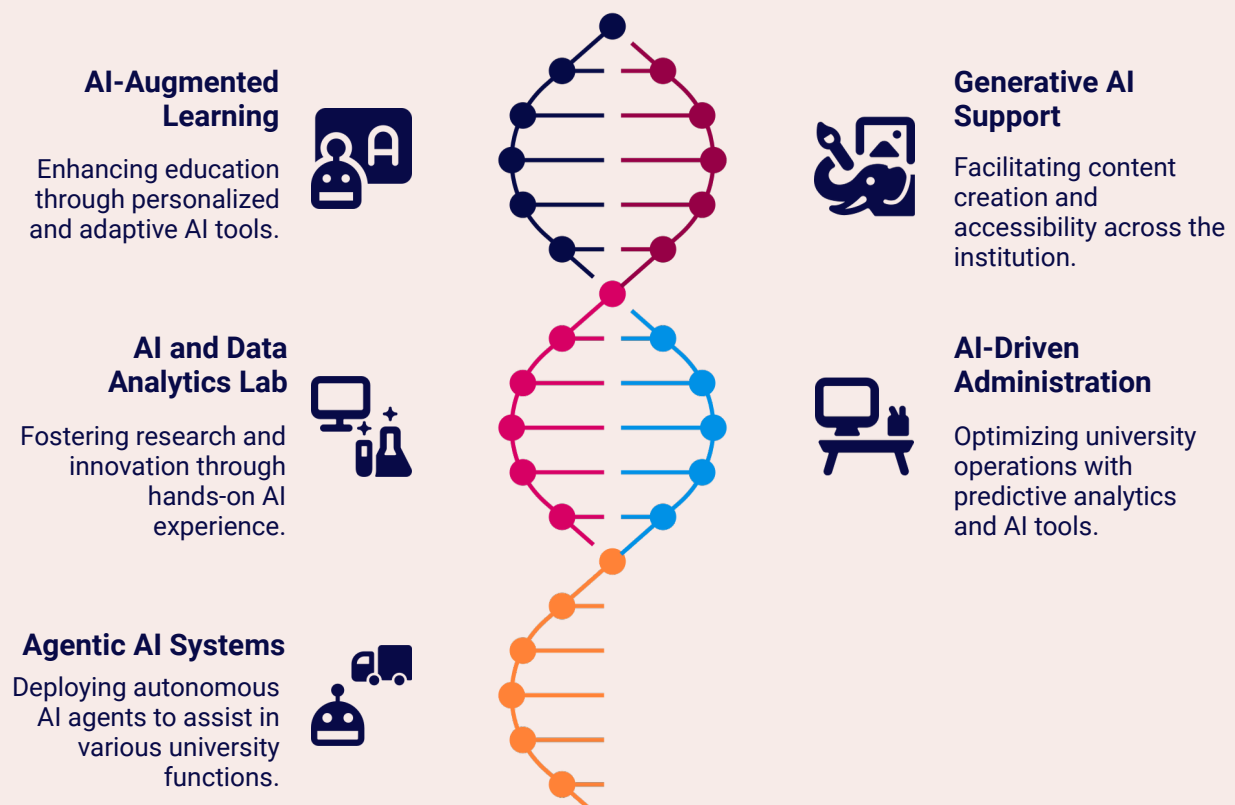

5. Artificial Intelligence and Generative AI

Artificial intelligence will be a game-changer in higher education, and we can empower AI Turath University to harness AI and generative AI (such as large language models) to enhance teaching, research and administration. Our approach is grounded in a human-centred and ethical use of AI, in line with UNESCO's global guidance, which emphasises putting human values and equity at the core of AI in education. Key initiatives include:

AI-Augmented Learning

Integrating AI tools into the learning process to provide personalised and adaptive learning experiences. For example, intelligent tutoring systems can offer students tailored practice exercises or feedback based on their progress. Students may use generative AI tools (like ChatGPT-style assistants) to generate practice questions, summarise complex readings, or explore what-if scenarios, always under proper guidance. Faculty can leverage generative AI to help design course materials, produce multilingual translations of content, or create simulations that respond to student input. To maintain academic integrity, clear policies will be established about appropriate AI use in coursework (e.g. disclosure of AI assistance, avoiding plagiarism). With the proper safeguards, AI can significantly enrich learning; for instance, some universities are experimenting with AI chatbots as digital tutors that quiz students (Stanford University has a chatbot that acts as digital flashcards to quiz students for exams). Such tools could improve study efficacy and will be tested at AI Turath in pilot courses.

AI Integration at AI Turath University

Generative AI for Content Creation

We will help the university explore using generative AI to support content creation and research. This might include generating draft text for routine institutional documents, creating sample datasets or code for teaching programming, or aiding researchers in literature reviews by summarising large volumes of academic papers. Generative AI can also power language tools to assist English-language learners or translate materials between Arabic and English, thereby improving accessibility. All AI-generated content will remain subject to human review – AI is a productivity aid, not a replacement for academic and professional judgment. By training faculty and staff in AI literacy, we ensure they can effectively use these tools and critically evaluate AI outputs (recognising limitations like possible biases or errors). Indeed, UNESCO’s 2024 AI competency framework for educators underlines the skills needed to work alongside AI, and we will adopt such guidelines in professional development programs.

AI-Powered Research and Innovation

Establishing an AI and Data Analytics Lab where students and faculty can experiment with machine learning techniques on real-world problems. This lab (potentially part of a new Center of Innovation) would provide computing resources (including GPU-powered workstations or cloud AI credits) to support coursework and research in AI. It aligns with Iraq’s national priority to advance AI capabilities and could attract external funding or partnerships. The lab would also promote interdisciplinary projects – for example, using AI in healthcare research or engineering – elevating the university’s research profile. Recent support for AI in Iraqi higher education, such as a \$2.1 million US grant to the American University of Iraq–Baghdad to establish an AI and digital innovation lab, shows such initiatives’ potential funding avenues and importance. AI Turath will seek similar collaborations or grants to build its AI infrastructure.

Administrative AI Tools

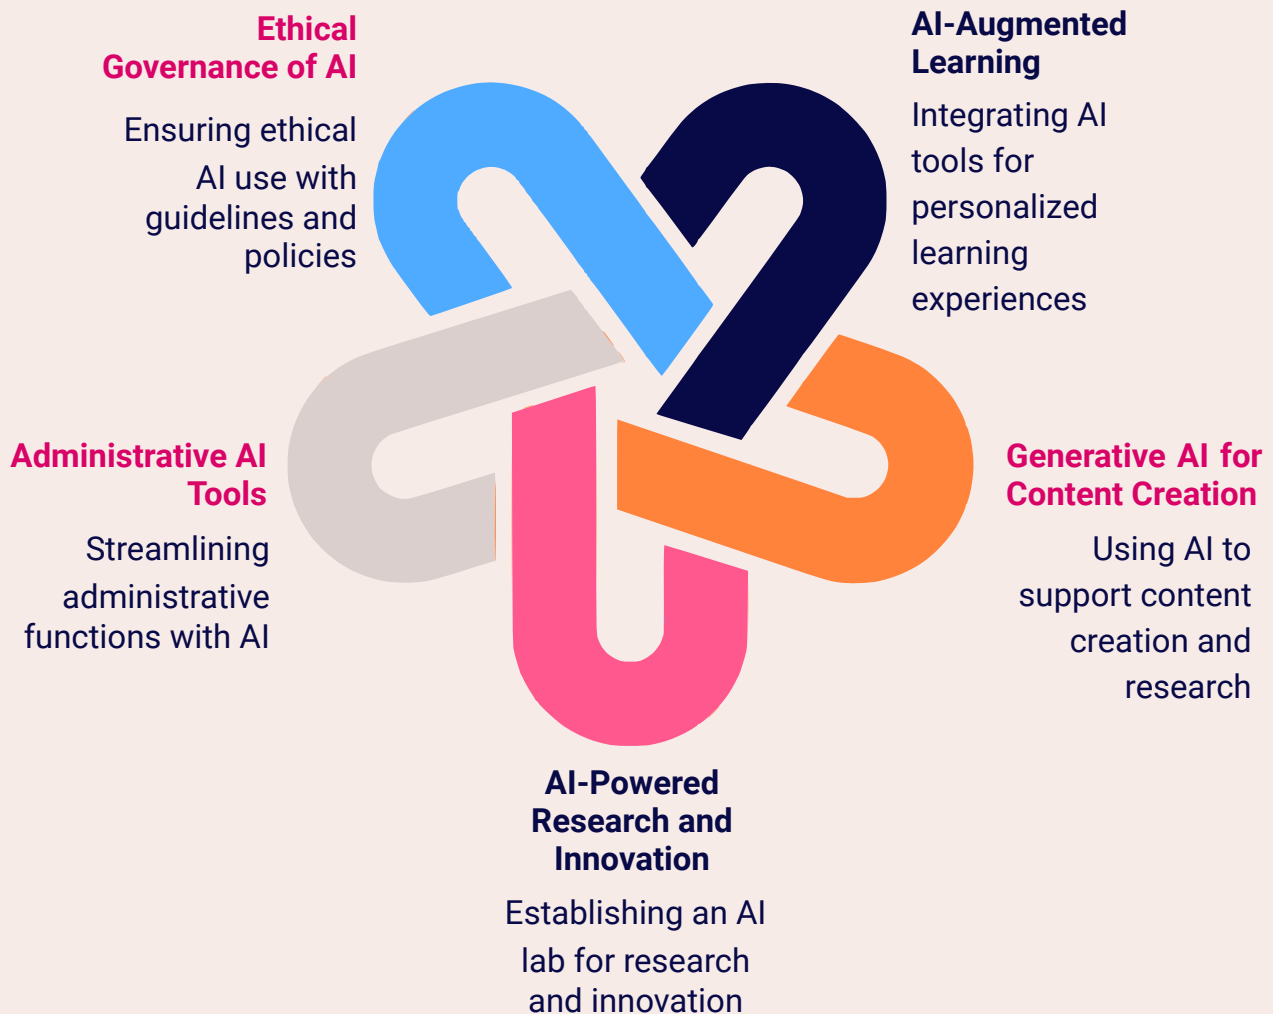

Beyond academics, we will support the university use AI to streamline administrative functions (detailed further in the next section on agentic AI). This includes employing AI for tasks like automated student advising (e.g. course recommendation systems that help students plan their degree path) or using machine learning to analyse operational data (for instance, predicting enrollment trends or optimising class schedules). Over time, data from various systems can feed AI models to provide predictive insights, such as identifying which students might need extra support or forecasting the impact of policy changes. These data-informed decisions will make the University’s operations more proactive and efficient.

Ethical Governance of AI

We will help the University establish an AI Ethics and Governance Committee to develop guidelines for AI use across the University. This body will ensure compliance with global ethical standards and local regulations, addressing issues like data privacy, algorithmic bias, transparency, and the impact on jobs. For example, if AI is used to evaluate student work or assist in grading, the committee will set policies to keep a human in the loop to prevent unfair outcomes. The committee will draw on recommendations such as UNESCO’s “Guidance for Generative AI in Education and Research” (2023), which provides a comprehensive framework for integrating generative AI tools safely and meaningfully in education. By proactively managing AI’s integration, AI Turath can avoid pitfalls and ensure that AI adoption upholds the University’s academic standards and values.

Overall, the strategy treats AI as a powerful enabler: automating mundane tasks, providing deeper insights from data, and offering personalised support to learners. By thoughtfully adopting AI and training our community in its use, AI Turath University can significantly enhance quality and innovation in teaching and administration. These efforts will contribute to building a future-ready institution where humans and AI work together to achieve educational excellence.

Enhancing Education with AI

6. Agentic AI in Administrative and Academic Functions

A particularly cutting-edge aspect of our plan is the introduction of agentic AI – AI systems with a degree of autonomy that can reason, adapt, and act on tasks to assist university operations. Agentic AI has the potential to function like virtual staff members or assistants, handling routine workflows and augmenting decision-making. By 2025, early examples of such AI “agents” have emerged (e.g. OpenAI’s prototype “Operator” agent that can use tools and perform tasks via a browser), and higher education stands to benefit tremendously from this trend. We will assist AI Turath University to gradually implement agentic AI solutions in areas such as:

Student Services Chatbots: Deploying AI chatbots to provide 24/7 support for student inquiries (admissions, enrolment, FAQs, IT helpdesk, library services). These chatbots can handle a large volume of routine questions, freeing up staff time. They will be capable of natural language conversation (in Arabic and English) to guide users through processes, for example, answering questions about the LMS or university policies. A successful case is Northwestern University’s chatbot that assists users with the learning management system around the clock. AI Turath’s chatbots will be continually refined with data and will escalate complex issues to human staff when needed, ensuring a smooth student experience.

Virtual Teaching Assistants: Integrating AI agents into the virtual classroom environment to support instructors. For instance, an AI agent could monitor online discussion boards, automatically flagging or even responding to common questions to keep students engaged. With faculty oversight, an AI assistant can pose follow-up questions to deepen discussion or provide instant feedback on quizzes, emulating some duties of a human teaching assistant. It can also track student submissions and alert the lecturer to any missing or late assignments, or unusual patterns (e.g. a student posting unusually short responses). By acting as a tireless aide, the AI frees instructors to focus on higher-order teaching tasks such as mentoring and content refinement.

Academic Administration: Using agentic AI to reduce administrative burdens. An AI agent can scan new research relevant to a department and compile summaries or suggestions for curriculum updates, ensuring academic programs stay current. It could also assist instructional designers by reviewing course syllabi and suggesting improvements or new resources from its knowledge base. At the end of each term, an AI could analyse course outcomes and student feedback, proposing data-driven adjustments for the next iteration of the course. These functions resemble a diligent research assistant working continuously in the background, as one expert imagines future AI “agents” to be like a 24/7 PhD-holding assistant for faculty.

Administrative Workflow Automation: Implementing AI agents in university offices to automate paperwork and routine decision support. For example, an agent could collate data and draft initial versions of reports (annual departmental reports, accreditation self-studies, grant proposals) which administrators then review and refine. It can fill forms, prepare recommendations, and route documents for approval, drastically reducing processing times. In the Registrar's office, an AI might help check student records for graduation eligibility and generate alerts for missing requirements. In HR, an AI could pre-screen job applications against set criteria, flag top candidates, and assist in scheduling interviews. These applications illustrate how agentic AI can tackle the "mountains of paperwork" in academia, initially under human supervision and eventually more autonomously.

Data Analysis and Decision Support: Employing AI to continuously analyse institutional data (enrolment trends, financial data, research output metrics, etc.) and present actionable insights. An AI agent might scrutinise recruitment and marketing data, suggesting micro-adjustments in outreach strategies to boost student applications. It could monitor social media and web analytics to inform the communications team's decisions. In facilities management, an AI could optimise schedules for maintenance staff or energy usage patterns. By having AI agents handle these complex but routine analyses, the leadership can receive up-to-the-minute reports and forecasts, supporting evidence-based decision-making at all levels.

The introduction of agentic AI will be done carefully and in consultation with stakeholders. Initial pilots (for example, a chatbot in one department or an AI assistant for a few faculty members) will help us evaluate effectiveness and address any concerns. We will also invest in training staff to work alongside these AI tools, shifting roles toward supervising AI outputs and handling exceptional cases, a trend anticipated in workforce transformation where AI takes over repetitive tasks.

The ultimate goal is not to replace staff but to augment human capabilities: allowing staff and faculty to devote more time to strategic, creative, and interpersonal aspects of their roles, while AI handles the heavy processing and administrative load. This aligns with emerging best practices in higher education, where agentic AI is seen as a means to simultaneously achieve greater efficiency and personalised attention.

Al Turath University positions itself at the forefront of innovation by embracing agentic AI. Many of these technologies are just becoming viable, so Al Turath's early adoption and experimentation will distinguish the University within Iraq and internationally. As always, human oversight, transparency, and ethical use will guide our implementation to ensure these AI agents earn the trust of our community and genuinely serve the University's mission.

7. Hologram Technology for Immersive Education

In keeping with the pursuit of cutting-edge educational experiences, we will explore how AI Turath University could leverage hologram technology to create immersive learning environments. Holographic displays can project three-dimensional lifelike images of people or objects, enabling novel ways to connect and engage in the classroom. Our vision is to leverage holograms for:

Guest Lecturers and Remote Teaching: Using holographic projection to bring remote experts and international lecturers “into” our classrooms in real time. Rather than a flat video conference, a hologram can provide a sense of co-presence – the illusion of being there with someone physically elsewhere. For example, a renowned professor in London could appear as a life-size hologram at AI Turath and interact with students almost as if in person. This offers the benefit of global expertise without travel costs or delays, aligning with eco-friendly practices by reducing travel-related carbon footprint. Early trials in the UK (Loughborough University) examine whether students find a hologram guest speaker engaging and “socially present” as an in-room teacher. AI Turath can partner with tech providers to pilot a holographic lecture in a large auditorium, thus placing itself among pioneering institutions in the region.

Interactive and Experiential Learning: Holograms allow the projection of 3D models and scenarios that can significantly enhance teaching in fields like medicine, engineering, or art and design. Instead of static images in a textbook, students could observe a rotating hologram of a human organ, an architectural structure, or a historical artefact, viewing it from all angles for deeper understanding. By controlling the holographic “pixels,” instructors might create immersive case studies or simulations: for instance, displaying a realistic scenario with actors via hologram and pausing at decision points for students to discuss options. This kind of live, visual case study can make abstract concepts tangible and improve knowledge retention. As another example, students in creative disciplines could present their work as holograms, bringing imagination to life and encouraging innovative expression.

AI-Enhanced Holographic Tutors: Combining hologram displays with AI could enable interactive avatar-based learning. A hologram does not need to represent a live person it could be an AI-driven avatar of a historical figure or a virtual mentor with whom students can converse. Imagine a history class where students “interview” a holographic avatar of an ancient scholar or national hero, with an AI providing the answers based on historical records. This merges the agentic AI concept with holographic presence, creating a highly engaging educational tool. Loughborough’s early exploration suggests such an avatar could embody a uni- versity’s values or culture to strengthen community connection. In the long term, Al Turath might develop its own AI-powered holographic guides (for example, a hologram of a famous Iraqi scientist who can answer STEM questions) to inspire and educate students interactively.

Immersive Telepresence and Collaboration: Beyond teaching, holograms can be used for administrative meetings, conferences, or inter-university collaborations. University board members or partners from abroad could appear via hologram for important events or seminars, underlining Al Turath’s technological sophistication. Likewise, students could participate in virtual academic competitions or cultural exchanges with peers overseas, interacting as holographic projections in each other’s venues. This sense of “being to- gether” across distances could enrich cross-cultural learning experiences.

Enhancing Education with Hologram Technology

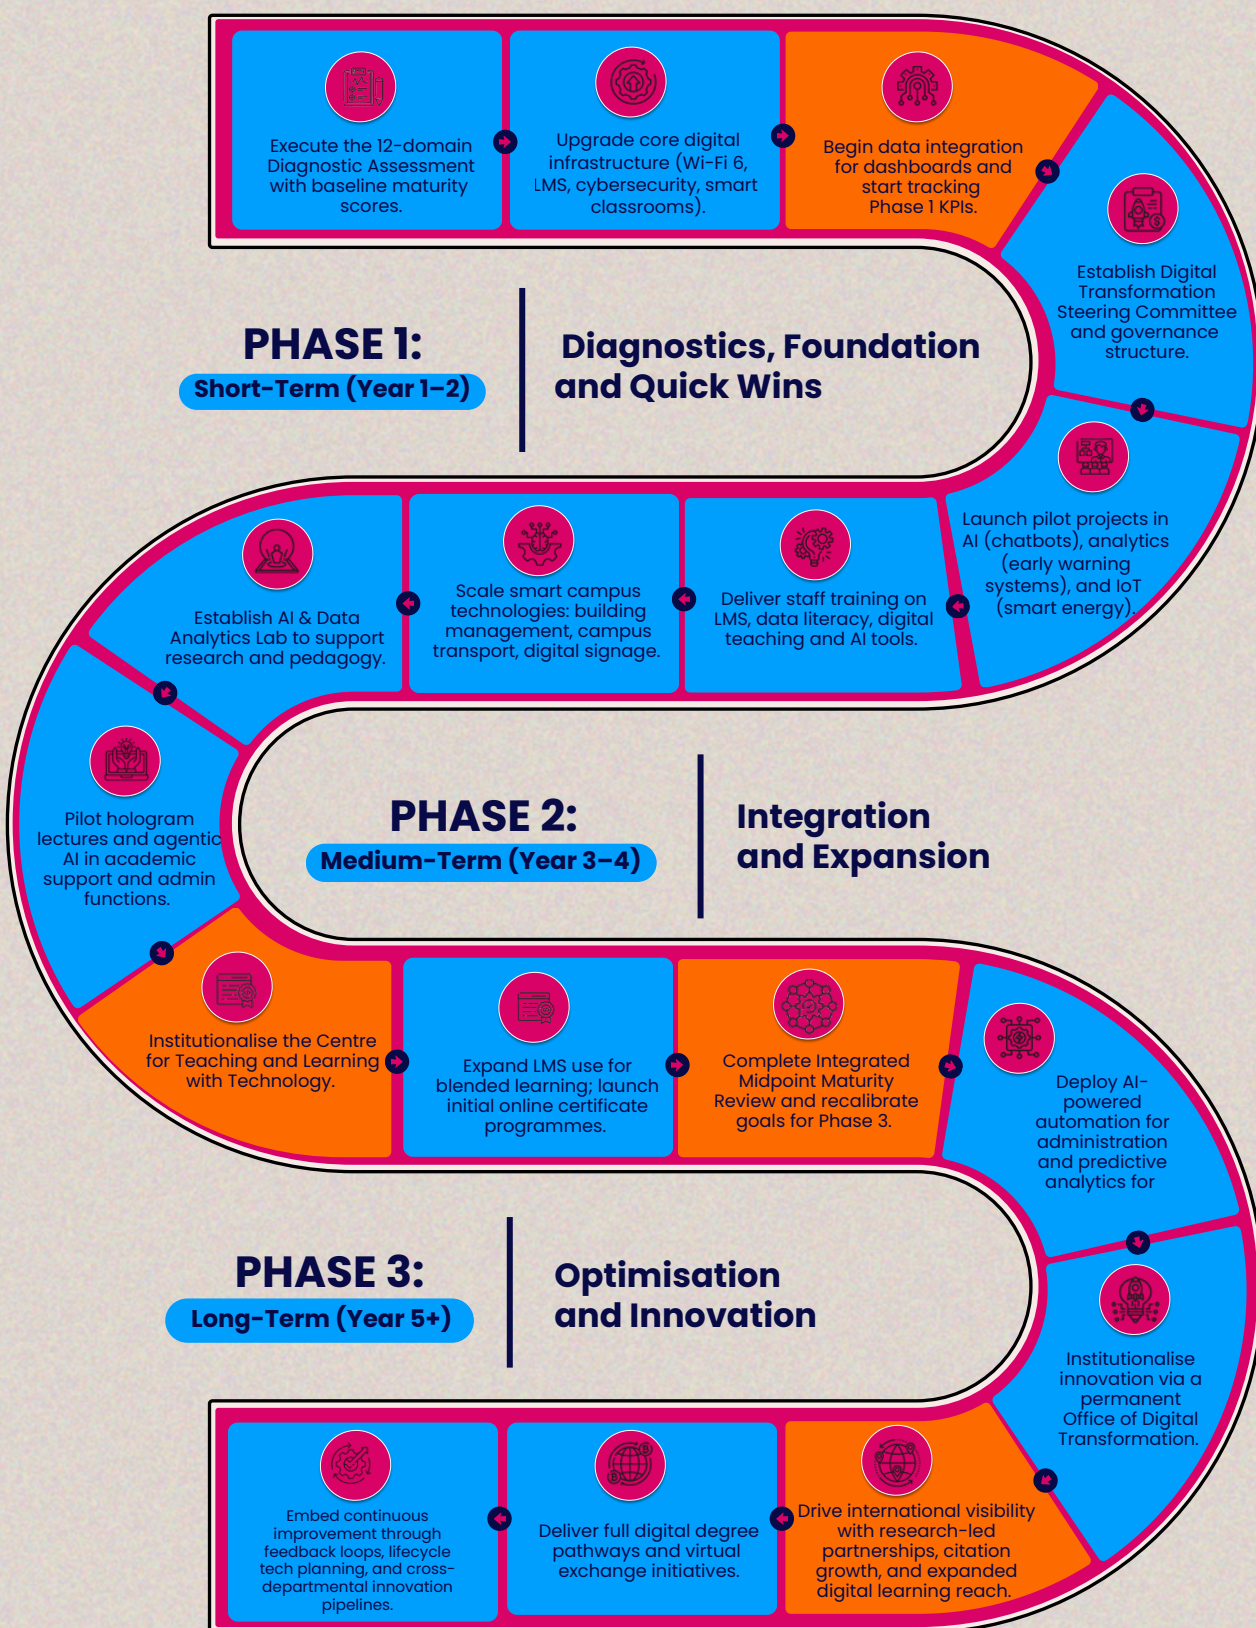

To implement holographic capabilities, the University will likely start with a “hologram classroom” or dedicated studio equipped with the necessary hardware (such as transparent LED screens or holographic projection boxes). Loughborough University’s approach, for example, uses box-type displays with high-quality transparent LEDs and special lighting effects to render a realistic 3D human or object. Over the next 1–2 years, we propose monitoring advances in hologram technology and conducting a small-scale trial. The trial goals would be to evaluate student perceptions of engagement and learning efficacy with holograms and to develop faculty training for effective use of this novel medium. We anticipate that hologram technology could move from a novelty to a regular feature of our pedagogical toolkit as costs come down and techniques improve. Adopting holograms will also require building new digital literacies among students and staff, understanding how to communicate and present in an immersive 3D context. We will include these considerations in our training programs.

By investing in holographic education, Al Turath University can differentiate itself as a regional leader in innovative teaching. While there are upfront costs and a learning curve, the potential returns regarding student engagement, global connectivity, and institutional reputation are significant. We will seek partnerships or sponsorships (perhaps from technology firms or cultural institutes) to support hologram pilot projects. The hologram initiative exemplifies the University’s commitment to providing students with world-class, future-oriented learning experiences.

PHASED IMPLEMENTATION ROADMAP

ATU's transformation journey aligns institutional health and digital capability building with measurable milestones. The roadmap phases below are synchronised with the diagnostic framework:

Each phase builds progressively toward an Optimised maturity model. By anchoring digital investment in institutional purpose and reputation, this roadmap secures long-term resilience and global visibility.

Phased Implementation Roadmap

Al Turath University's transformation journey combines institutional health uplift and digital capability building. The three phases below are structured to align with budget cycles, staff capacity and the twelve-domain framework outlined earlier. Each phase deepens maturity in technology and governance, teaching, research, student experience and external engagement, ensuring the University's reputation grows in step with its digital sophistication.

Phase 1: Short-Term (Year 1–2) Diagnostics / Foundation and Quick Wins

Goal: Establish the groundwork for digital transformation and achieve early successes to build momentum.

Integrated Digital-and-Institutional-Health Assessment: Conduct a baseline evaluation of ATU's current capabilities across all twelve domains (governance, people, processes, data, technology, stakeholder outcomes). The assessment uses an industry-validated maturity benchmark with five levels (*Initial* → *Optimised*) and produces a heat-map that sets quantitative targets for improvement.

Governance and Strategy: Form a Digital Transformation Steering Committee (including leadership, IT, academic staff, and students) to oversee the initiative. Develop a detailed digital strategy document and update relevant policies (e.g. IT usage, online learning, data security) to support transformation. Ensure the strategy is integrated into the University's overall strategic plan ("the university strategy in a digital world" rather than a standalone IT plan).

Infrastructure Upgrades (Foundational): Invest in critical infrastructure improvements immediately. This includes campus-wide high-speed internet (upgrade Wi-Fi and wired networks), enhancing server capacity or cloud subscriptions for LMS and administrative systems, and improving cybersecurity defences. Also, modernise classroom technology by equipping a set of pilot "smart classrooms" with updated computers, projectors/interactive boards, and lecture capture tools.

LMS and Platform Optimisation: Optimise the LMS and train faculty on its advanced features. Push for every course to use the LMS for at least basic materials and communication. Implement an online video conferencing integration for virtual classes or guest lectures. These quick wins will visibly improve the student experience early on.

IoT Pilot Projects: Deploy a limited IoT pilot focused on energy efficiency and safety. For example, install smart thermostats and occupancy sensors in one or two buildings, and implement an IoT-based access control system in a dormitory or lab. These can demonstrate cost savings and gather data to justify broader IoT expansion.

AI and Analytics Pilots: Introduce a chatbot on the University website to handle common inquiries (admissions or IT help). Provide a small group of interested faculty access to AI tools (like a GPT-based teaching assistant in the LMS) under controlled conditions and gather feedback. Also, start using basic analytics from LMS and student records to inform advising (perhaps identify struggling first-year students and intervene).

Capacity Building: Initiate training sessions for staff and faculty on key new systems (LMS usage, data security practices, basic data analysis, etc.). Raise awareness through seminars about the transformation goals and how each person can be involved. Early adopters and digitally savvy staff can be highlighted as champions to encourage peer learning.

Phase 2: Medium-Term (Year 3–4)

Integration and Expansion

Goal: Build on the foundation to integrate digital solutions across more domains and scale up successful pilots.

Smart Campus Expansion: Scale IoT deployment to cover the broader campus. By this time, plan to implement smart HVAC and lighting in all significant buildings, campus-wide security IoT systems (networked surveillance and alarms), and a unified dashboard for facilities management to monitor these systems. Additionally, the smart transportation and parking system should be rolled out if not done in Phase 1, so that real-time shuttle info and parking availability are accessible to users.

Digital Learning Maturity: Launch a **formal Centre for Teaching and Learning with Technology** that supports faculty in course redesign for digital formats. By Year 3, aim for a significant percentage of blended courses or web-enhanced courses. Introduce one or two fully online certificate programs, potentially, leveraging the improved LMS and Faculty skills. Continue investing in digital content libraries and subscribe to global digital courseware as needed. Student feedback and outcome data should be used to iterate on improvements each semester.

Advanced AI Integration: Establish the **AI and Data Analytics Lab** by Year 3, using internal funding or external grants. Introduce more sophisticated AI tools: for example, an AI-driven academic advising system that can suggest degree plans or an AI tool that scans research funding opportunities and matches them with faculty interests. Experiment with an agentic AI assistant in one administrative department (e.g. let an AI help the Marketing department by analysing social media engagement and drafting weekly content suggestions). Evaluate the impact on efficiency and adjust workflows accordingly. At this stage, the University's AI policies will also be refined based on Phase 1 experiences and evolving global best practices.

Hologram Classroom Pilot: Implement a pilot hologram teaching session, perhaps by inviting a partner university professor to “beam in” as a holographic lecturer for a special talk or a module. Use this to test technical feasibility (setup, bandwidth, display quality) and to gather student reactions. If positive, plan to procure a permanent holographic display setup and include holographic guest lectures as a periodic feature in various faculties (for instance, one per semester in different departments).

Systems Integration and Data Strategy: By Year 3, work on integrating data from various systems (IoT platforms, LMS, SIS, HR, finance) into a central data repository or warehouse. Develop a campus analytics dashboard for leadership that can show key metrics (enrollment trends, space utilisation, student engagement levels, etc.) at a glance. This will support evidence-based planning and can highlight returns on investment from the digital initiatives.

Policy and Culture Evolution: Revisit and update policies such as intellectual property (for digital content created), remote work or study policies (since more online elements are in place), and data governance. Culturally, continue encouraging innovation – perhaps institute an internal grant or award for faculty experimenting with novel edtech or AI in their work. Ensure recognition and incentives are aligned so staff remain motivated through the changes. A midpoint review of the digital transformation should be conducted at the end of Year 4 to measure progress on the THE DMI dimensions and adjust strategies as needed.

Integrated Mid-Point Maturity Review: Carry out a mid-point Integrated Maturity. Re-run **the Integrated Digital-and-Institutional-Health Assessment** to update the heat-map, report KPI progress and recalibrate Phase 3 priorities, budget and risk mitigations.

Phase 3: Long-Term (Year 5 and beyond) Optimisation and Innovation

Goal: Achieve a high level of digital maturity (“Optimised” stage) where data and innovation drive continuous improvement are institutionalised.

Fully Smart and Connected Campus: By Year 5 and beyond, the aim is for AI Turath University to function as a fully smart campus. IoT systems will be pervasive—every building, classroom, and service potentially generates data to optimise real-time operations. For example, intelligent systems automatically adjust resource allocation: if data shows low utilisation of a facility at certain hours, schedules are adjusted, or areas are repurposed dynamically. Thanks to AI analysis of IoT sensor data, maintenance may become predictive (fix issues before failure).

Digital by Default in Academics: All programs should leverage digital platforms extensively. Even traditional in-person programs will have rich online supplements and data-driven support structures. The University could launch **online degree programs** accessible to students nationwide, capitalising on the digital infrastructure and experience gained. Virtual exchange programs or multi-campus online collaborations might be routine, giving students a global exposure. At this stage, digital pedagogy is a core strength of the university – new faculty hires are chosen partly for their adaptability to innovative teaching, and the University’s reputation for digital learning excellence attracts students.

Advanced AI and Agentic Systems: The University will continuously adopt the latest AI advancements. In the long term, agentic AI might handle complex tasks autonomously, such as running a “digital twin” of the university for scenario planning. We envision AI assisting in strategic decisions, for instance, modelling the impact of opening a new program or building, thus aiding governance. Administrative processes could be heavily automated: a student applying to AI Turath might experience a nearly instantaneous, AI-guided admissions process (from application review to initial advising). Daily operations, from library management to alumni outreach, would be optimised by AI recommendations. Human staff roles will have shifted to oversight, strategy, and interpersonal engagement that AI cannot replicate.

Institutional Innovation & Research Leadership: As a mature digital institution, AI Turath should also contribute to innovation in the sector. We aim to host digital education conferences or join international research consortia on edtech, AI in education, and smart campus development. The University can share data and outcomes from its transformation (respecting privacy) to help other Iraqi or regional institutions in their journeys, thereby establishing AI Turath as a national leader in digital transformation. New areas like big data research, cybersecurity, or AI ethics could become research focus areas for the University, building academic prestige.

Continuous Improvement Mechanisms: Even after initial goals are met, digital transformation is an ongoing process. We will institutionalise continuous feedback loops: regular student and faculty surveys on digital services, an innovation pipeline for proposing and piloting new technologies, and periodic re-evaluation of our digital strategy. By Year 5, the University should have a permanent Office of Digital Transformation (or equivalent) ensuring that we remain at the cutting edge and that any technological obsolescence is proactively addressed through lifecycle upgrades. Essentially, the culture of the University will embrace change and value agility and lifelong learning, which is the hallmark of an optimised digital organisation.

This phased roadmap is currently conceptual but strategic– it outlines the kinds of steps that need to be achieved by when, without prescribing overly rigid steps. The diagnostic reviews conducted in stage one will determine actions and details on the most effective way forward for the institution. Flexibility will be maintained to adjust to new opportunities (for instance, a new government grant or a breakthrough technology might accelerate certain parts). Progress will be measured throughout each phase using our Digital Maturity Index criteria, aiming to move from mostly *Intentional* implementations in Phase 1 to **Integrated** in Phase 2, and towards an **Optimised** state in Phase 3. Importantly, each phase’s completion will be celebrated and communicated to sustain enthusiasm among stakeholders. This gradual, well-prioritised approach ensures the digital transformation is sustainable and delivers tangible value at each step, building confidence for further investments.

Funding Opportunities and Models

Identifying and securing funding is critical to implement this digital transformation. The proposal recommends a mix of funding sources and models, leveraging both internal and external opportunities available in Iraq's higher education landscape:

Government Funding and Grants: Aligning our plan with national strategies enhances prospects for government support. Iraq's Ministry of Higher Education and Scientific Research has adopted a "futuristic vision" for full digital transformation and is likely to fund related projects. We will support the university in its efforts to actively seek grants or budget allocations under initiatives like the newly launched Digital Transformation and Automation Center at the Ministry. Furthermore, Iraq's public spending on education is projected to

increase (with targets of 16% of the budget by 2030), and a special budget item for education transformation projects is being established. AI Turath can advocate for some of these funds by demonstrating our readiness and a detailed plan aligned with national goals. We can help the university prepare proposal documents to submit to the Ministry, highlighting how our project can serve as a model for other universities in Iraq.

International Grants and Partnerships: There is significant international interest in uplifting Iraq's higher education through digital means. For example, the U.S. Department of State recently funded a \$2.1 million grant to AUIB (American University of Iraq-Baghdad) to advance AI and digital education initiatives. We can support AI Turath University to pursue similar opportunities through U.S. Embassy programs, the United Nations (UNESCO, UNDP) or the World Bank, which often supports educational ICT projects in

developing regions. The European Union has also been involved in Iraq's education sector (as a co-chair in education coordination, so EU funding (Erasmus+ capacity building grants, for instance) could be sought for components like faculty training or building digital infrastructure. Additionally, membership in the Digital Cooperation Organization (DCO), which Iraq joined in 2024, may open doors to expertise exchange and funding from a coalition of tech-forward countries. We will actively network with these bodies and respond to calls for proposals that match our project components.

Industry Partnerships (Public-Private Partnerships): Collaborating with technology companies can defray costs and bring cutting-edge expertise. Potential partners include global tech firms (such as Microsoft, Google, Amazon Web Services, Cisco, and Huawei) with education outreach or donation programs. For instance, companies might provide cloud credits, discounted hardware, or even direct investment in exchange for pilot testing new solutions on campus. We will explore programs like Microsoft's Azure Education

credits for AI and cloud, or Cisco's Networking Academy for training and equipment, which could substantially benefit our plans for infrastructure and training. Local telecom providers in Iraq (e.g. Zain, Asiacell) could also partner on upgrading campus connectivity or sponsoring smart campus features as part of their corporate social responsibility. A structured outreach will be done to engage such companies, highlighting that partnership with AI Turath University will showcase their technology's impact in the education sector.

Institutional Budget and Phased Investment: We will assist the University with strategically allocating funds over multiple fiscal years. By phasing the project, we can dedicate a portion of our annual capital expenditure to digital transformation – for example, year 1 budget focusing on network hardware, year 2 on IoT devices, year 3 on lab facilities, etc. Efficiencies gained (such as energy savings from IoT or streamlined processes from AI) can be quantified, and the cost savings redirected to further investment (a

virtuous cycle). We will treat some digital initiatives not just as costs but as potential revenue enablers: launching online programs could generate tuition revenue, and digital improvements might attract more students or external research grants, strengthening the University's finances. The proposal suggests creating a Digital Transformation Reserve Fund where any annual budget surplus or special donations are earmarked for these initiatives, ensuring continuity of funding.

Collaboration with International Universities: Beyond direct funding, forming partnerships with well-resourced international universities can help share costs or obtain in-kind support. Joint grants (for example, via Erasmus+) could fund exchanges of experts, curriculum development for digital skills, or research into digital education effectiveness. We can assist Al Turath seek a mentor relationship with a university that has undergone a similar transformation, which might provide low-cost consultancy or software resources. The referenced partnership between AUIB and Vanderbilt University in establishing education and AI programs is an

inspiring model – a similar approach could be to partner with a UK university to gain expertise and possibly access to their digital platforms under license.

In pursuing these funding avenues, it's crucial to articulate the value proposition: how our digital transformation will contribute to national development, student empowerment, and workforce readiness in Iraq. We will highlight that investment in Al Turath's digital capacity helps produce graduates skilled in emerging technologies (AI, IoT, etc.), which aligns with Iraq's economic priorities. Moreover, by phasing projects, funders can target the phase that matches their interest (some might fund infrastructure, others capacity building, etc.). We will also maintain transparency in fund utilisation and demonstrate impact with measurable indicators (energy saved, students served online, etc.) to build trust with funding providers.

Finally, funding sustainability will be addressed by integrating ongoing costs (software licenses, cloud services, equipment maintenance) into the University's operating budget from the start. The Board's commitment to prioritising digital initiatives in financial planning will be key. As Iraq increases education spending to approach international benchmarks, Al Turath University can confidently leverage that trend, ensuring we find startup funds for projects and maintain and grow them in the long run.
